

## Bias Detection Report

The analysis of the Adult dataset revealed a significant correlation between the sex and education features. The Chi-squared statistic was 297.71500372503687 and the p-value was 1.6677784409205074e-54, indicating that the null hypothesis of no correlation can be rejected. The bias level was calculated to be 4, indicating a moderate to high level of bias.
