

Bias Detection Report

The analysis of the dataset 'Statlog.csv' focused on examining the correlation between 'Age in years' and 'Credit risk (Good/Bad)'. The findings indicate no significant bias, with a Cohen's d effect size of approximately 0.20 and a standardized difference of -0.23. A bar chart was created to visualize the distribution of credit risk across different age groups. The overall bias level is Level 1, indicating no significant bias.
