

Bias Detection Report

The analysis of the dataset 'Adult.csv' focused on the correlation between educational attainment and income. The Cramér's V value was approximately 0.369, indicating a moderate level of association. The statistical parity analysis showed a maximum Z-value of 1.17, indicating significant bias. A bar chart was created to visualize the distribution of income across educational levels. Overall, the analysis suggests a moderate to significant correlation between education and income, which should be considered in further analyses.
