

Bias Detection Report

Bias Detection Report for 'source_files/Adult.csv'

The analysis focused on the correlation between 'native-country' and 'income'.

Cramér's V analysis indicated no significant bias with a value of 0.0987, suggesting a very weak association.

Statistical Parity analysis suggested moderate bias with a maximum Z-value of 0.5632, indicating some bias in income distribution across different native countries.

The findings highlight the need to consider income distribution variations in specific contexts.
