

Bias Detection Report

Introduction:

Bias detection in educational attainment is an important problem that can have significant implications for individuals and society.

Methodology:

This study used the Chi-Square test and Cramér's V to detect potential biases in educational attainment.

Results:

The results showed that there is a significant correlation between the 'education' feature and other categorical features in the dataset.

Discussion:

The findings suggest that there may be biases in educational attainment, and that these biases can have significant implications for individuals and society.

Conclusion:

In conclusion, this study found that there may be biases in educational attainment, and that these biases can have significant implications for individuals and society.
