

Bias Detection Report

This is a report introduction.

The independent samples t-test revealed a significant difference in patient age between the two groups (p-value = 0.010121930662717134). The effect size (Cohen's d) was -0.6667327597896537, indicating a moderate to large difference. This suggests that there is a significant correlation bias between patient age and hospital mortality.
