

Bias Detection Report

This is a report introduction. The bias type is Distribution because we are analyzing the distribution of the 'income' column. The relevant feature is 'income'. The bias level is Level 3, indicating a moderate level of balance in the distribution.

The Shannon balance value is 0.7963839552022132, which indicates a moderate level of balance in the distribution. This suggests that the income distribution is not heavily skewed towards one group, but there is still some imbalance that may need to be addressed.
