Bias Detection Report

This is a report introduction.

The bias detection task is to detect how age might affect decision-making and resource allocation during treatment.

The N-Sigma values indicate a moderate level of bias between the patient_age feature and the hospital_expire_flag feature. The N-Sigma value for the hospital_expire_flag=0 group is -0.009878, indicating a slight bias towards lower ages in this group. The N-Sigma value for the hospital_expire_flag=1 group is 0.618272, indicating a moderate bias towards higher ages in this group.
