Bias Detection Report

The final answer is: The overall bias level is Level 5, which indicates extreme bias. This is because the results show significant correlation and distribution bias between several pairs of features, including categorical and numerical features. The bias is detected in several pairs of features, including 'Status of existing checking account' and 'Credit history', 'Purpose' and 'Property', and 'Housing' and 'Property'. The results suggest that the bias is due to correlation and distribution differences between the features.
