Bias Detection Report

Bias Type: Correlation

Relevant Features: Patient Age, Hospital Mortality (hospital_expire_flag)

Bias Level: Level 3

Additional Explanation: The analysis reveals a moderate correlation between patient age and hospital mortality. This suggests that age may play a role in determining hospital outcomes, with older patients potentially having a higher risk of mortality. However, this is a statistical observation and should be interpreted with caution, considering other potential confounding factors.

Overall Bias Level: Level 3
